Part 3: True/Fales & Multiple choice questions:

(____ / 5 points)

1. Every cout statement automatically starts a new line. **TRUE** / **FALSE**
2. The compiler will still run your program even if there's a syntax error. **TRUE** / **FALSE**
3. A program can have code outside of main(). **TRUE** / **FALSE**
4. return 0; prints the number 0 to the screen. **TRUE** / **FALSE**
5. What does int main() represent in a C++ program?

☐ A) An optional decoration you can leave out

☐ B) The single fixed starting point where execution begins

☐ C) A comment explaining what the program does

☐ D) A loop that repeats the program

6. What's the real difference between a compiler error and what happens at runtime?

☐ A) There is no difference — they're the same thing

☐ B) A compiler error stops the program from ever building; runtime is what happens after it successfully starts

☐ C) Runtime errors always happen before compiling

☐ D) Compiler errors only affect comments, never real code

7. Why does the order of lines inside main() matter?

☐ A) It doesn't — C++ runs lines in any order it wants

☐ B) Statements execute top to bottom, one at a time, so earlier lines can affect what later lines do

☐ C) Only the last line in main() actually runs

☐ D) Order only matters for cout, not for other statements
